

## 1    **ABSTRACT OF THE DISCLOSURE**

2            A safety switch for a water dispenser includes a knob adapted to be rotatably  
3    mounted on the pushbutton and having an extension integrally formed with the knob and  
4    an abutting plate formed on an outer periphery of the extension, and a stop adapted to be  
5    integrally formed on an inner face of the panel to correspond to and engage with the  
6    abutting plate so as to prevent the movement of the pushbutton. After the rotation of the  
7    knob to misalign the abutting plate with the stop, the pushbutton is able to be pressed to  
8    release water from the water dispenser.
